

INVESTIGATION OF DIFFERENT SOLAR HYBRID GAS TURBINES AND EXPLOITATION OF REJECTED SUN POWER

C. Kalathakis

Research Assistant

N. Aretakis

Assistant Professor

I. Roumeliotis

Assistant Professor

A. Alexiou

Senior Researcher

K. Mathioudakis

Professor

**Laboratory of Thermal Turbomachines
National Technical University of Athens**

Motivation & Objectives

- **Fuel saving and emissions reduction → use of renewable energy**
- **Solar thermal power in Brayton cycle for air preheating**

- ❖ **Identify most promising GT configuration in terms of performance**
- ❖ **Study hybridization type: retrofitting existing engine or design for solar-only operation**
- ❖ **Exploit rejected Sun power to augment solar share and improve performance**

□ INTRODUCTION

- Hybridization
- Modelling

□ PERFORMANCE STUDIES

- Gas Turbine Configurations & Hybridization Type
- Design Specifications & Operating Scenario
- Fuel-Only Engines Solar Retrofitted (FRS)
- Engines With Solar-Only Operation At Design (SDP)

□ DUAL FLUID RECEIVER

□ SUMMARY & CONCLUSIONS

□ INTRODUCTION

- Hybridization
- Modelling

□ PERFORMANCE STUDIES

- Gas Turbine Configurations & Hybridization Type
- Design Specifications & Operating Scenario
- Fuel-Only Engines Solar Retrofitted (FRS)
- Engines With Solar-Only Operation At Design (SDP)

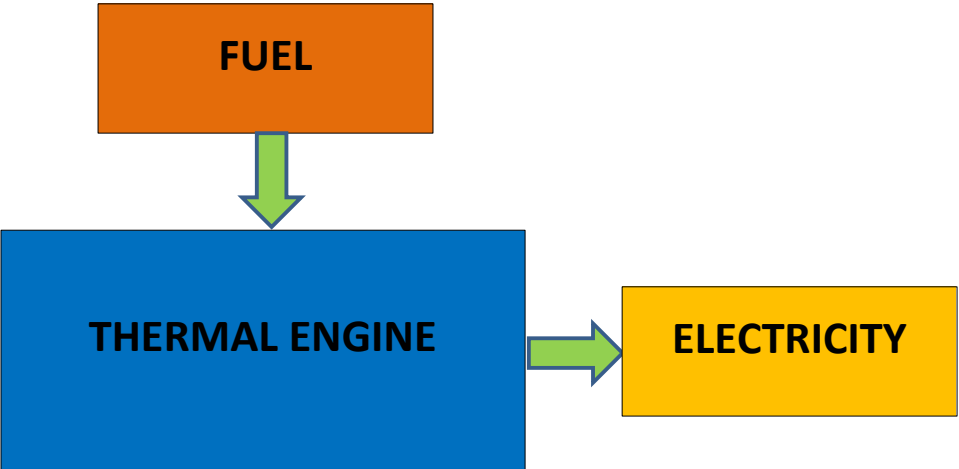

□ DUAL FLUID RECEIVER

□ SUMMARY & CONCLUSIONS

Hybridization

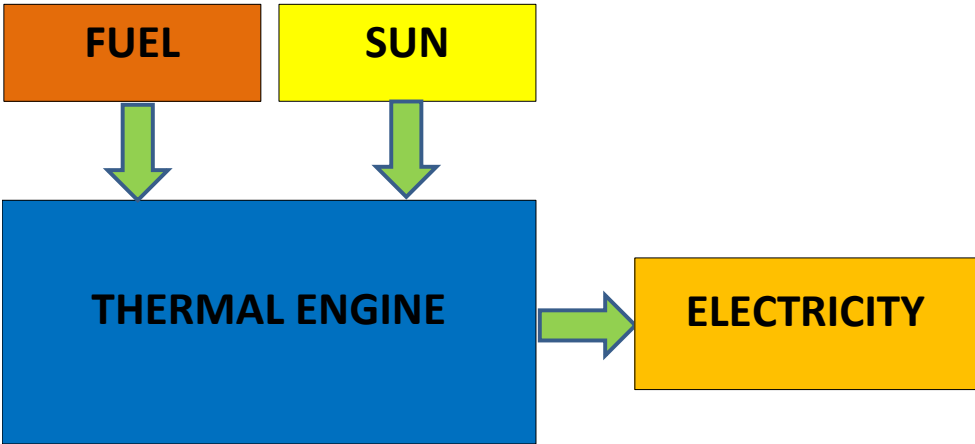

**CONVENTIONAL
CONFIGURATION**

HYBRIDIZATION

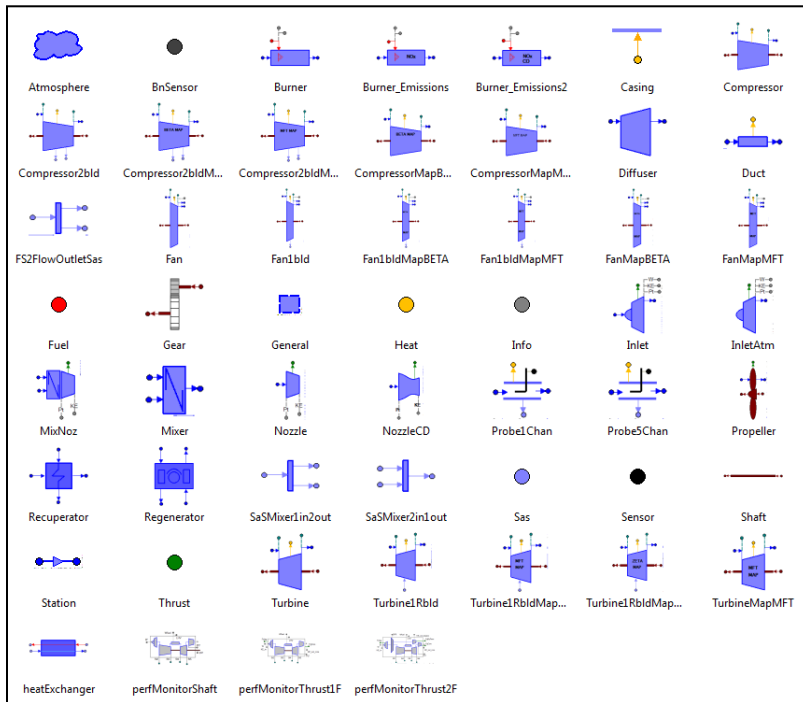

**SOLAR THERMAL
CONFIGURATION**

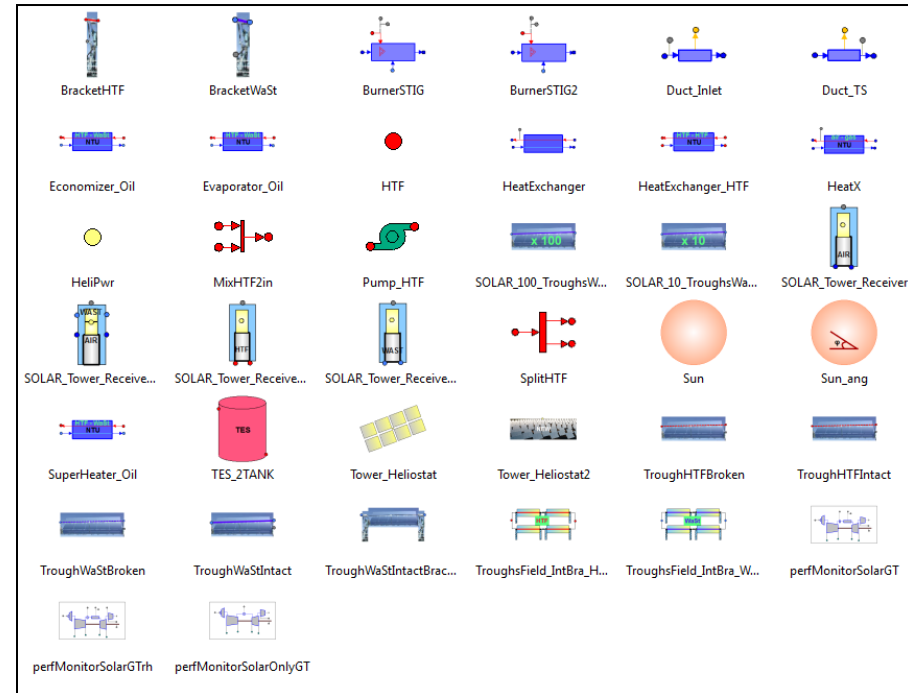

Modeling

- **PROOSIS: Object oriented simulation environment**
- **Library components: Mathematical model of real world component**
- **TURBO: Brayton cycle components**
- **SOLAR: Solar part components**

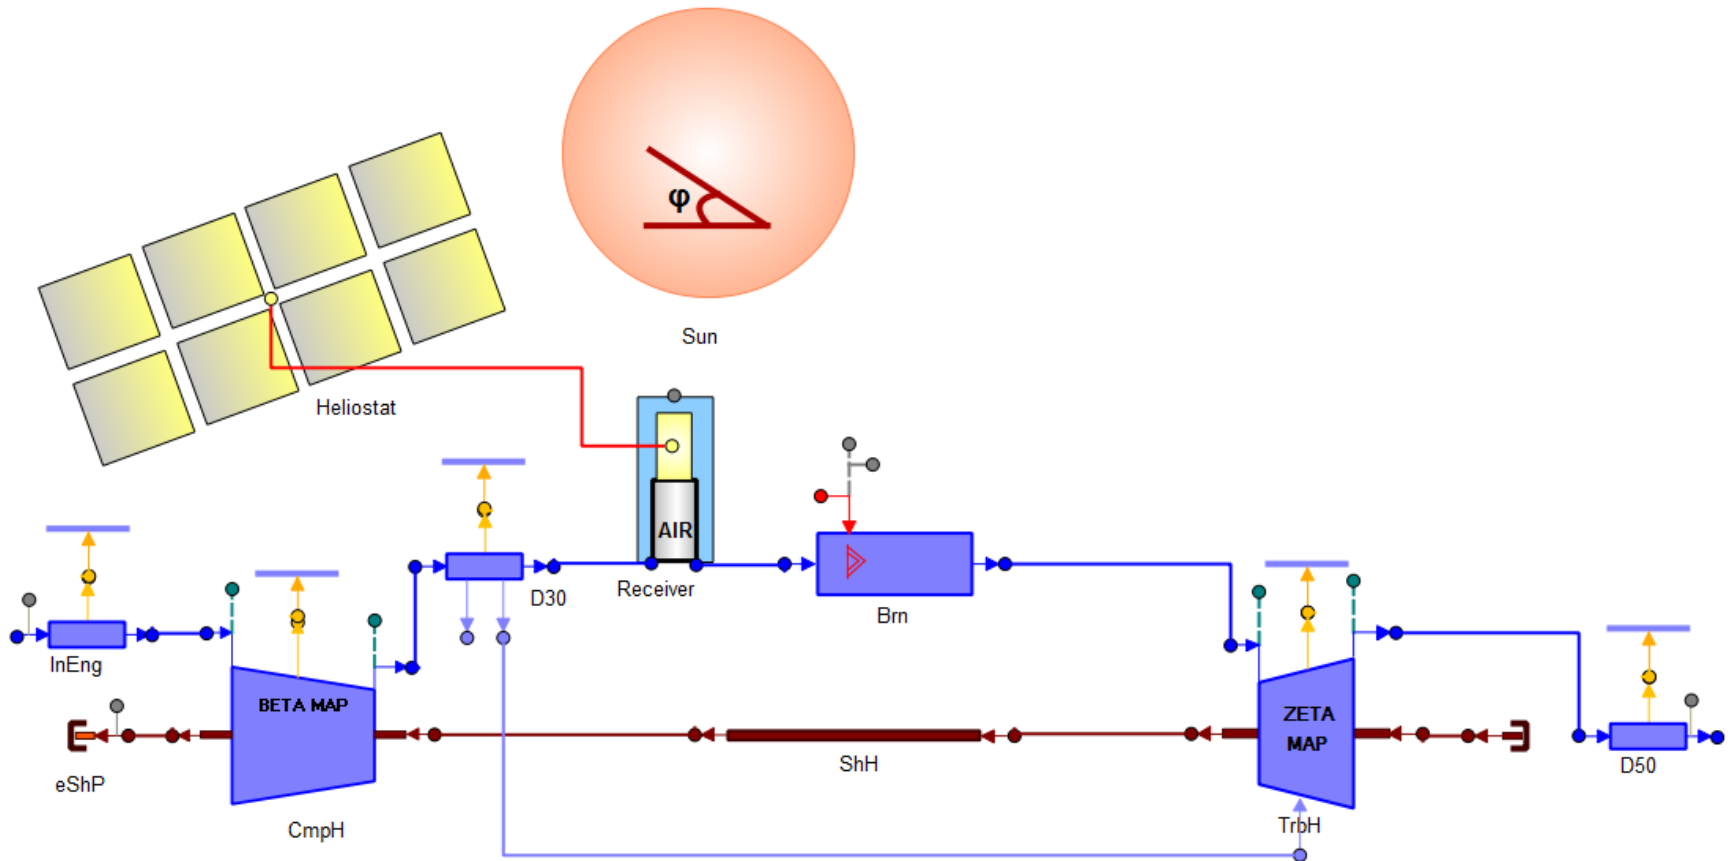

TURBO library

SOLAR library

Modeling

Hybrid GT model in PROOSIS

□ INTRODUCTION

- Hybridization
- Modelling

□ PERFORMANCE STUDIES

- Gas Turbine Configurations & Hybridization Type
- Design Specifications & Operating Scenario
- Fuel-Only Engines Solar Retrofitted (FRS)
- Engines With Solar-Only Operation At Design (SDP)

□ DUAL FLUID RECEIVER

□ SUMMARY & CONCLUSIONS

Studied Configurations

Single Shaft (SS)

Single Shaft Recuperated (SS_R)

Twin Shaft (TS)

2Sp 3Sh Inter. Rec. (2Sp3Sh_I_R)

Type Of Hybridization

- **Fuel-only engines solar retrofitted (FRS)**
 - **Fuel-only operation at design point → Retrofitting → Solar hybrid operation**
- **Engines with solar-only operation at design (SDP)**
 - **Designed with solar-only operation at design point**

Design Specifications

- **First (pilot) plants MW scale – Demonstrated hybrid GT 4.5MWe on Tower**
 - 5MW engines chosen
- **Receiver range: Up to 1000°C and 10bar**
 - High solar share & specific power → TIT = 1000°C & PR = 10
- **Heliostat field**
 - Receiver outlet temperature = TIT @ 600W/m² Summer solstice

Operating Scenario

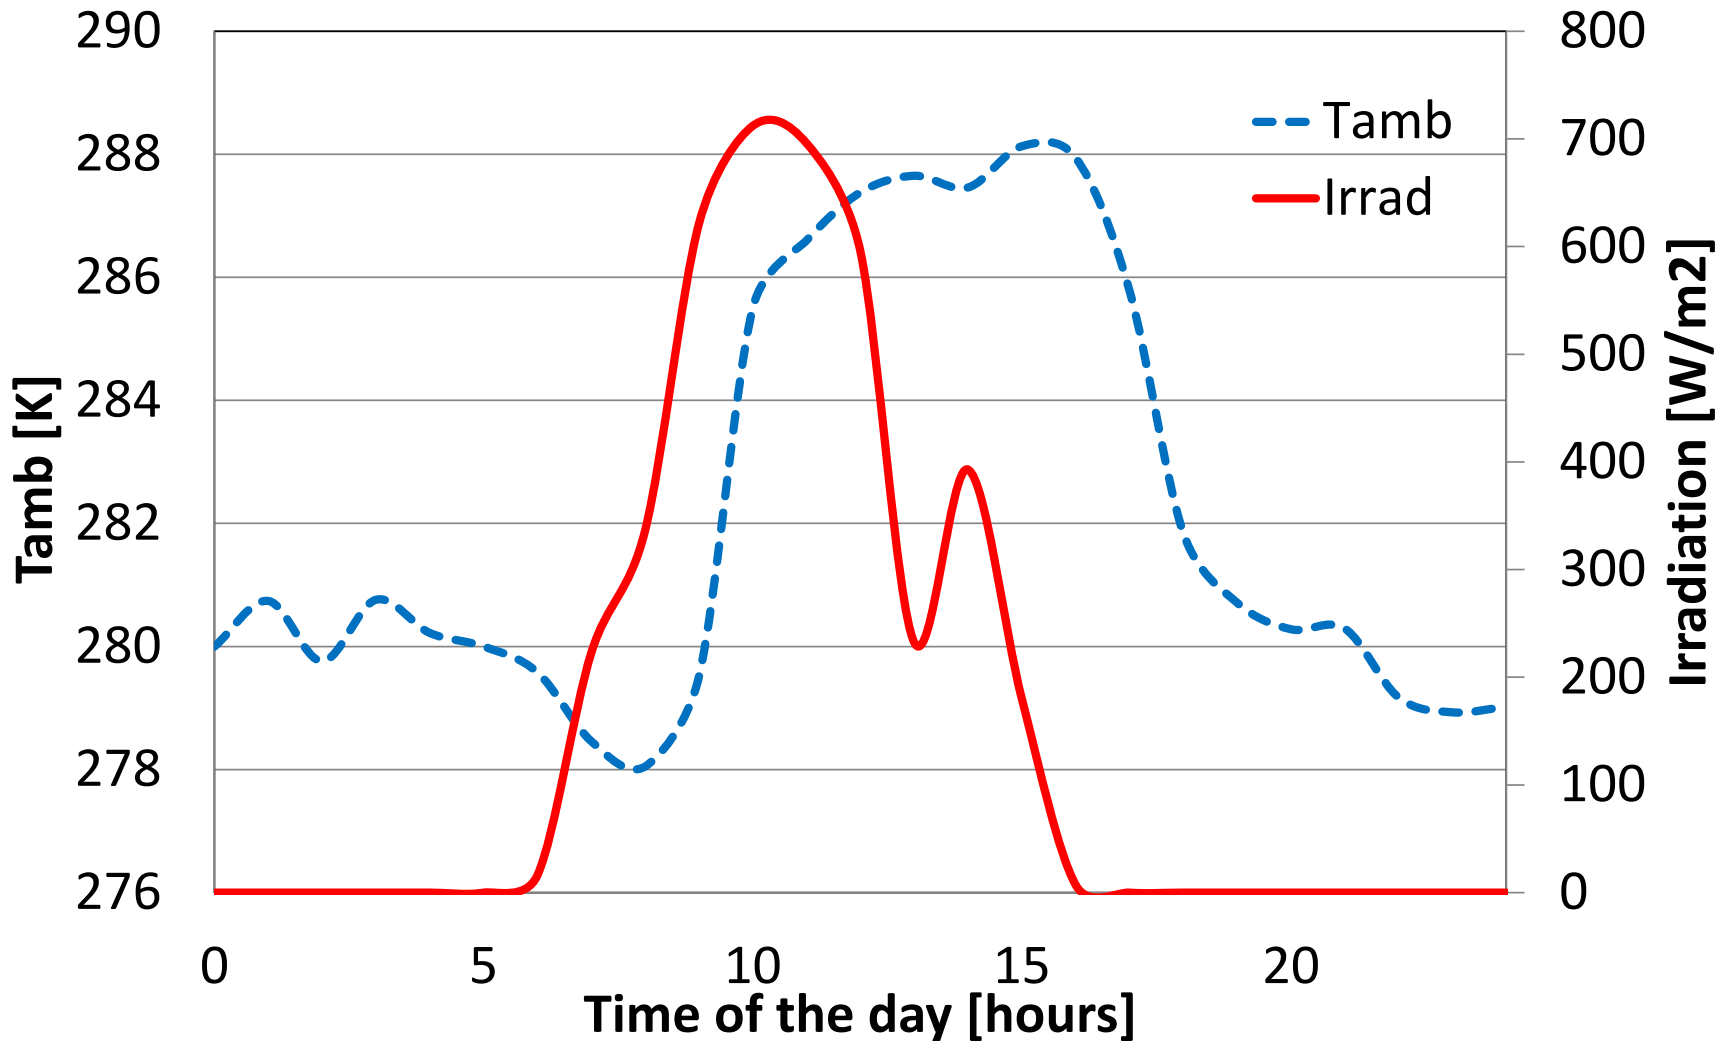

- **Operating scenario**
 - **Yearly continuous baseload operation → TIT constant**
- **Performance simulation**
 - **Hourly performance simulation → Integration → Annual performance**

Ambient Data

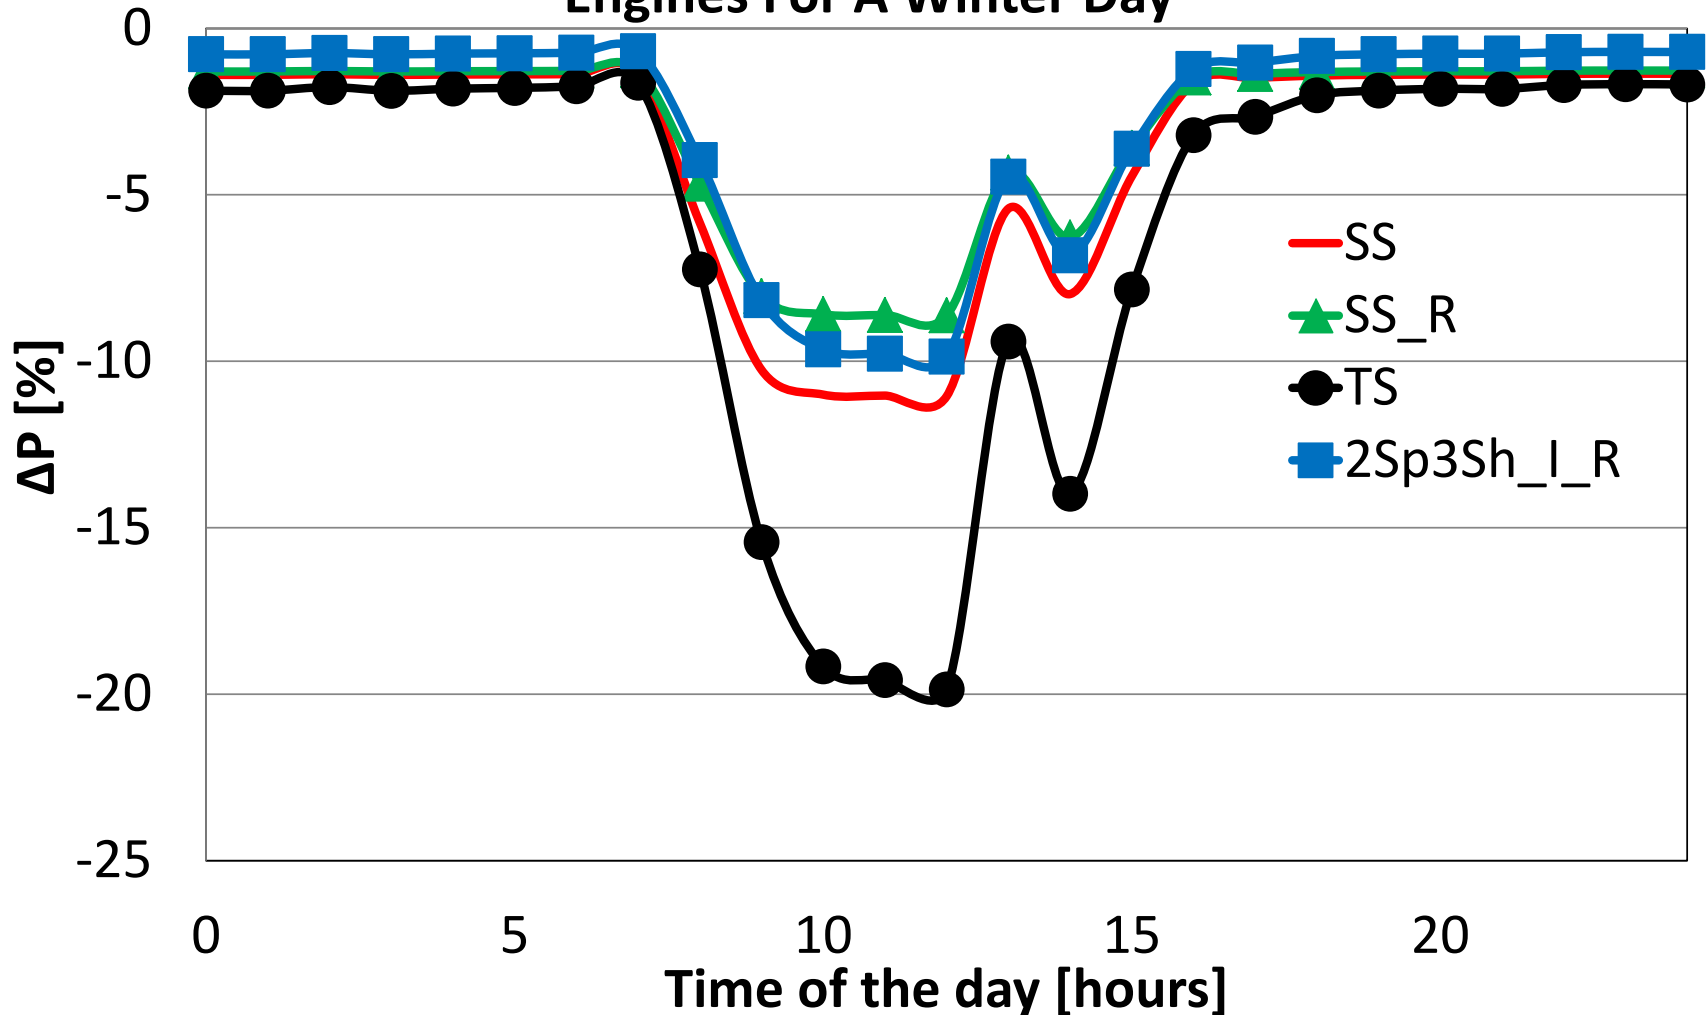

Ambient Temperature & Irradiation For A Winter Day

Daily Performance Of FRS Engines

Produced Power Difference Between Fuel-only & FRS Engines For A Winter Day

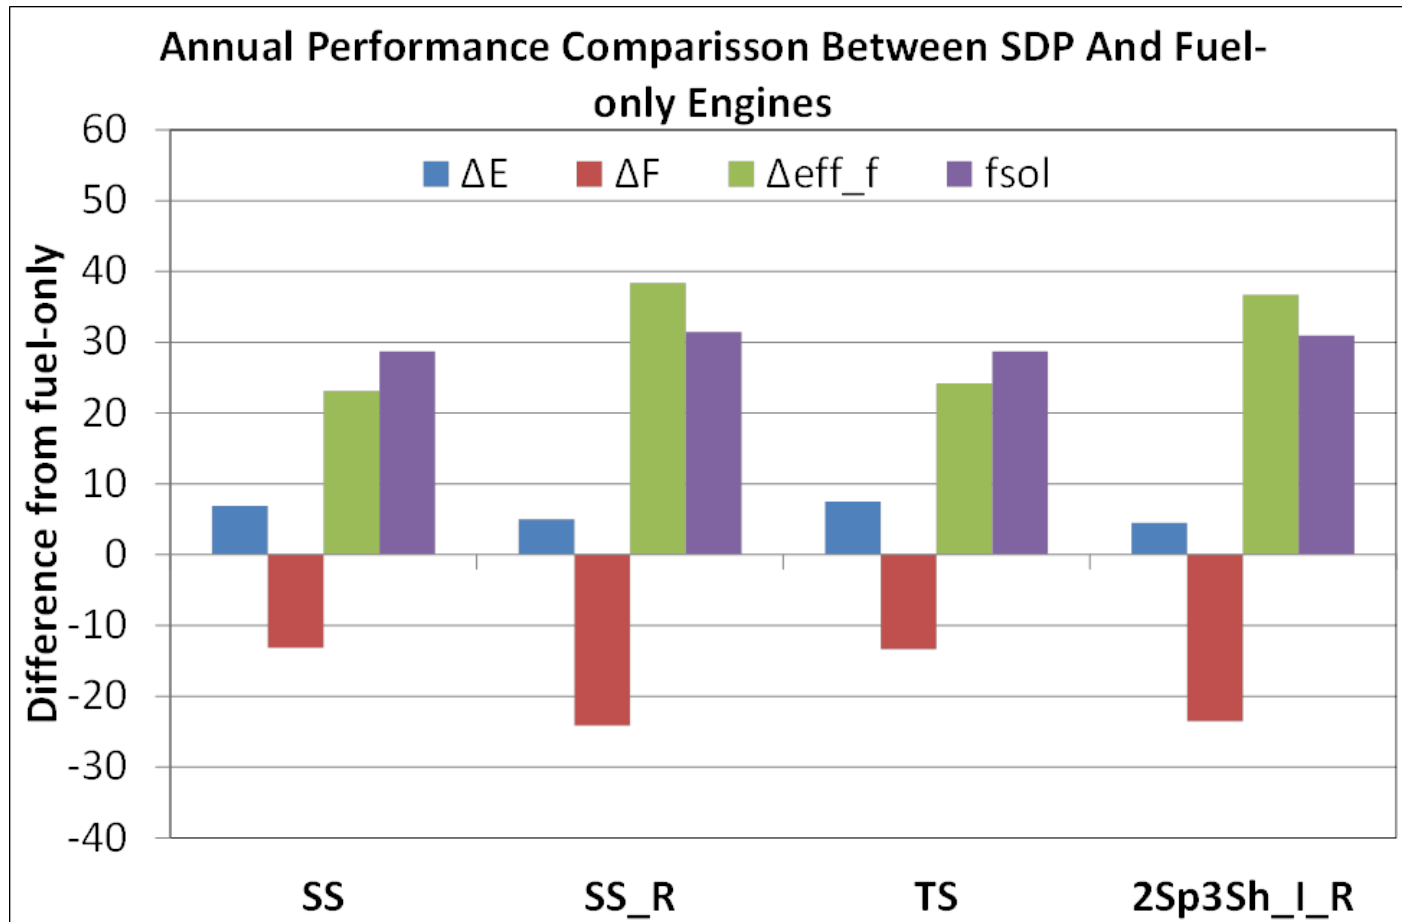

Annual Performance Of FRS Engines

- **Energy reduction:** a) Receiver pressure drop, b) working fluid change
- **Recuperated configurations → higher solar share and fuel efficiency, lower energy production penalty**

Annual Performance Of SDP Engines

- Energy augmentation due to higher mass flow
- Recuperated configurations: higher solar share and fuel efficiency, lower energy augmentation

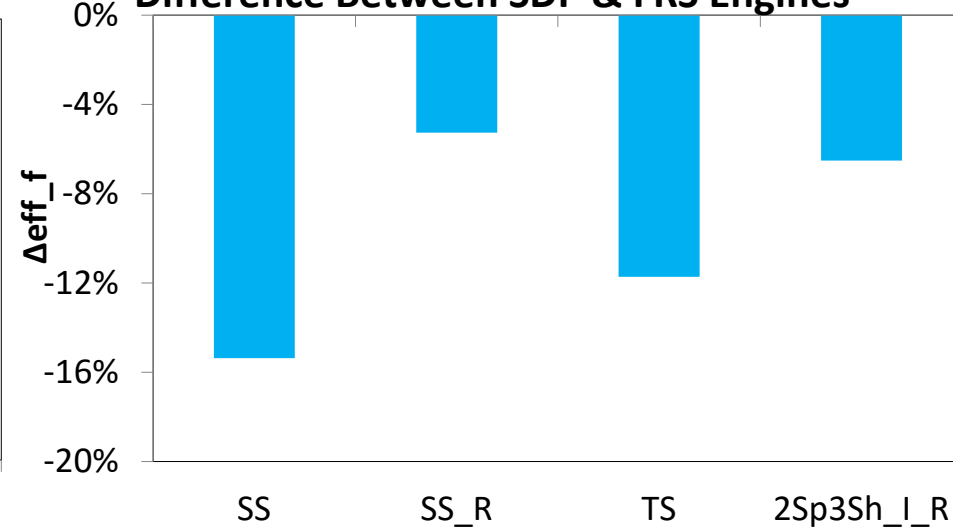

Comparison Between FRS And SDP

Air Mass Flow Difference Between SDP & FRS Engines At Design Point

Annual Fuel Thermal Efficiency Difference Between SDP & FRS Engines

- FRS → higher specific power
- FRS → higher fuel efficiency

□ INTRODUCTION

- Hybridization
- Modelling

□ PERFORMANCE STUDIES

- Gas Turbine Configurations & Hybridization Type
- Design Specifications & Operating Scenario
- Fuel-Only Engines Solar Retrofitted (FRS)
- Engines With Solar-Only Operation At Design (SDP)

□ DUAL FLUID RECEIVER

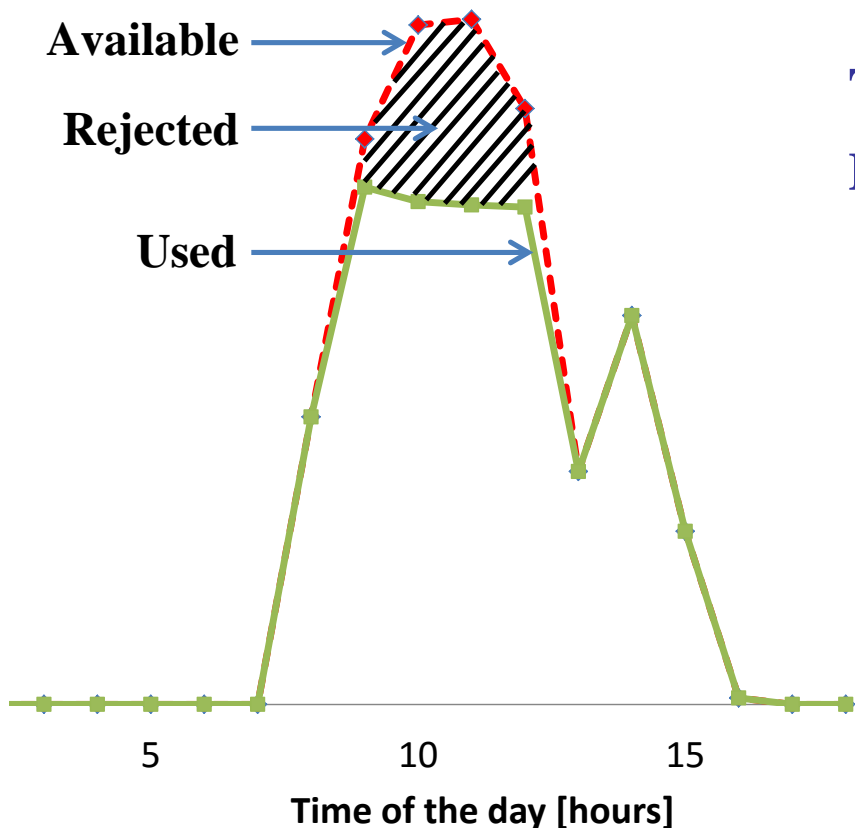

□ SUMMARY & CONCLUSIONS

Exploitation of Rejected Sun Power

Receiver outlet temperature limit → Defocusing mirrors → Rejected solar power

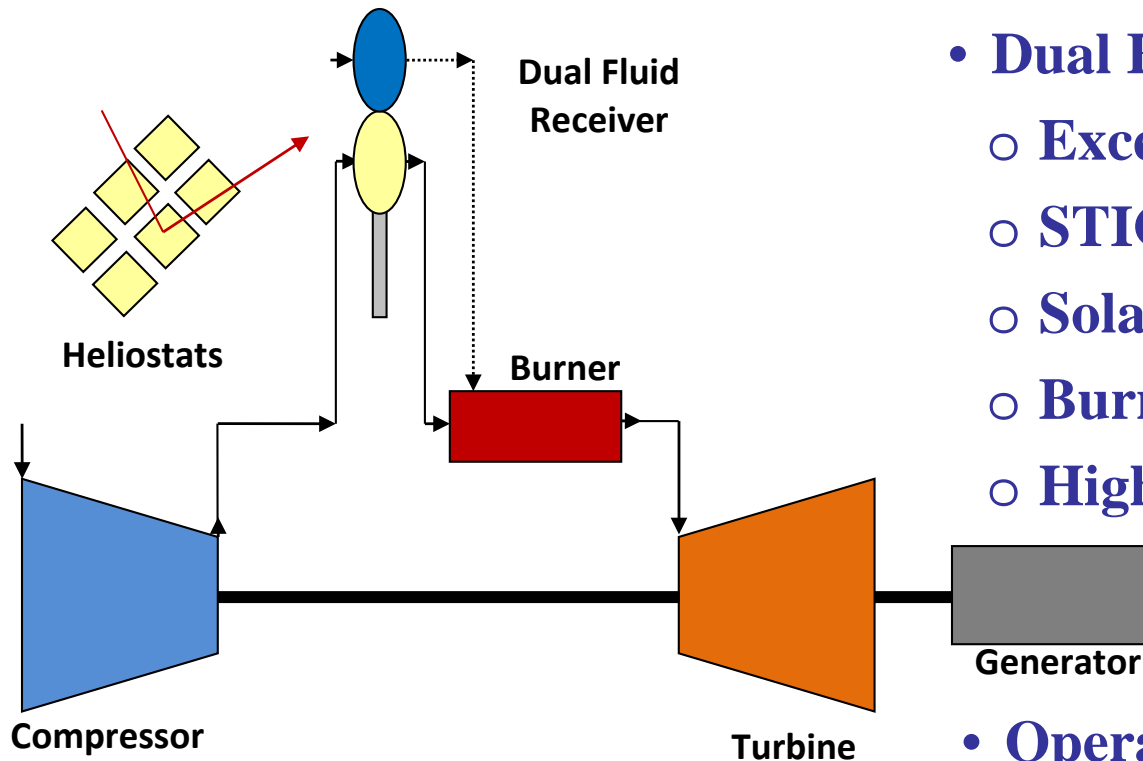

Higher solar share requires the exploitation of this power

Thermal Storage (regenerative)
Research subject

An alternative ...

Dual Fluid Receiver (DFR)

- **Dual Fluid Receiver (DFR)**
 - Excess power for STIG
 - STIG: Used technology
 - Solar steam: Used technology
 - Burner cooling
 - Higher solar share & power
- **Operation**
 - Focusing on secondary receiver
 - Steam pressure 20bar
 - Water flow → Saturated steam
 - Surge margin check

Exploitation of Rejected Sun Power

Annual Performance Comparison Between Hybrid And Fuel-only Engines

- No energy production penalty
- Higher solar share
- Same magnitude of fuel saving

□ INTRODUCTION

- Hybridization
- Modelling

□ PERFORMANCE STUDIES

- Gas Turbine Configurations & Hybridization Type
- Design Specifications & Operating Scenario
- Fuel-Only Engines Solar Retrofitted (FRS)
- Engines With Solar-Only Operation At Design (SDP)

□ DUAL FLUID RECEIVER

□ SUMMARY & CONCLUSIONS

Summary – Conclusions

- ❑ **Developed Solar Library to enable solar hybrid GT cycle modelling**

- ❑ **Studied different gas turbine configurations and hybridization types**
 - **Recuperated schemes appear more suitable for solar hybridization**
 - **Fuel-only engines solar retrofitted (FRS) show higher specific power and fuel thermal efficiency compared to solar-only operation at design point (SDP)**
 - **Optimum design between FRS and SDP operation to be established**

- ❑ **An alternative to thermal storage for exploitation of rejected power was shown: Dual Fluid Receiver for STIG**
 - **Removes energy production penalty**
 - **Based on proven technologies (STIG & solar steam production)**
